Portastor Deliver West Coast Mainline Trackside Power:

As part of the Euston to Glasgow West Coast Mainline upgrade programme Portastor have built bespoke switchgear modules for five sites, recently delivering and installing the first Phase 2 housings between Birmingham and Manchester.

Comprising three Portastor equipment modules totalling almost 20 meters the combined power switchgear and control rooms were initially delivered via tight access roads prior to being positioned onto their pre-fabricated sub-structures. The work was performed during Network Rail isolations and possessions and at one of the sites installation took place at night.

Buildings for Wembley, Stone and Colwich are currently having third party switchgear installed and integrated at York prior to deployment.
