Bespoke Control Equipment Rooms for Oil Terminal

As part of the Volatile Organic Compound (VOC) Recovery Project at Teesside Oil Terminal Portastor has designed, manufactured and delivered two bespoke control equipment rooms, which collect 100% of the vapour displaced during petroleum ship loading. Both rooms were fitted out with third party switchgear and control equipment prior to delivery and were installed on pre-prepared concrete pillars.

Portastor furnished the pre-fabricated platforms and stairs. Working under Highways Agency Abnormal Loads VR1 approval the 6M wide equipment rooms were transported in stages to Teesside prior to being craned into place by the Portastor Facilities Management Team.
